Tarzana Treatment Centers
The Wall Las Memorias Project
Watts Healthcare Foundation, Inc.

Executive Summary

Prevalence and Use Behaviors

- Among Los Angeles County (LAC) residents aged 12 and older, 12.7% reported ever misusing prescription (Rx) medication (e.g., pain relievers, sedatives/benzodiazepines, stimulants) at least once in their lifetimes.
- The prevalence of current Rx medication misuse (at least once in the past 30 days) among LAC residents aged 12 and older was 2.1%.
- On average, those who misused Rx medication in the past month did so for 9 days out of 30.
- The average age of first misuse of Rx medication among LAC residents aged 12 and older was 21 years. Of those who ever misused (PWMRx¹), 38.1% first misused Rx medication before age 18.
- Among respondents who had misused Rx medication, 50.3% had misused opioids, 40.2% had misused sedatives, and 23.5% had misused stimulants.
- Overall, 10.7% indicated having close friends who misuse Rx medication, while 10.0% indicated having family members who misuse.

Accessibility/Availability

- Over half (57.8%) of LAC residents aged 12 or older perceived that prescription pain medication would be easy to access around their neighborhood, with PWMRx indicating perceptions of greater access than non-PWMRx (63.9% vs. 56.7%, respectively).
- Among those who had ever misused Rx medication, nearly half (47.9%) reported that it was easy for them to access prescription medication without a prescription.

- PWMRx most commonly obtained their prescription medication from friends (40.6%), followed by doctors (25.3%), home (23.4%), dealers/illegally (22.4%),
- Nearly one-fifth (19.6%) of LAC residents aged 12 and older reported they have unused or expired (left-over) Rx medication where they live. This figure was slightly higher among those who had misused Rx medication (20.9%) than those who had not misused Rx medication (19.4%).

Risk Perceptions and Attitudes

- Of LAC residents aged 12 or older, 69.0% perceived that it is a great risk for youth to misuse prescription medication 1-2 times per week (i.e., regular misuse).
- Of LAC residents aged 18 or older, 68.3% perceived that it is a great risk for adults to misuse prescription medication 1-2 times per week (i.e., regular misuse).
- PWMRx were less likely than non-PWMRx to perceive that regular Rx medication misuse is a great risk for youth (58.7% vs. 70.4%) and adults (57.0% vs. 70.2%).
- Of LAC residents aged 12 or older, 86.3% indicated that their close friends would disapprove of them misusing prescription medication. This perception of peer disapproval was more pronounced in non-PWMRx (88.8%) than in PWMRx (69.8%).
- Of LAC residents 12+ years of age, 14.0% indicated that they would either “agree” or “strongly agree” that it is okay to share used or expired (left-over) Rx medication with family or friends who need them.
- LAC residents aged 12 and older believed the best ways to dispose of unused Rx medication was to drop them off at drop-off locations or take-back events (34.0%) or at safe drug sheriff stations (26.4%). However, many believed that flushing them down the toilet (23.9%) and throwing them in the trash (23.4%) were the best ways to dispose of them.

¹ “PWMRx” indicates a person who has ever misused prescription medication, while “non-PWRx” indicates no previous misuse.

Purpose

The Community Needs Assessment (CNA) was a community-wide effort to address the current data gap for smaller regions, specific topics, and underrepresented demographic groups related to prescription (Rx) medication misuse and associated problems and perceptions, and to identify disparities and potential risk or protective factors to target communities in Los Angeles County (LAC). The CNA provides a comprehensive profile of substance use problems that will facilitate community prevention service providers, other stakeholders, and policymakers in making informed decisions about prioritizing problems, strategic planning, and resource allocation for implementing solutions to address the needs of the target communities.

CNA Workgroup

The CNA Workgroup was established to oversee and conduct the CNA, to ensure geographic and sociodemographic coverage, and to conduct the CNA in a culturally competent way throughout the process. The CNA Workgroup was comprised of representatives from the Health Outcomes and Data Analytics (HODA) Division and Prevention Services Division at the LAC Department of Public Health (DPH), Substance Abuse Prevention and Control (SAPC) Bureau, and SAPC-contracted community prevention service providers. The CNA Workgroup was led by HODA Division and worked closely together in the project conception, planning, survey design and development, pilot testing, community outreach, participant recruitment, and data collection.

Research Ethics

The CNA project was approved by the LAC DPH Institutional Review Board.

Adaptation of 2017 CNA

This survey tool was adapted from the first round of the CNA (2017) which included questions about Rx medication misuse and marijuana use. The current CNA tool preserved the wording of previous items as much as possible, while also revising and extending some items (e.g., attitudes about sharing Rx medication) and expanding the scope of the survey to also include questions about methamphetamine, alcohol, and heroin.

Survey Tool

The survey was a comprehensive 72-item questionnaire that included questions about a variety of substances including: methamphetamine, alcohol, heroin, marijuana, and prescription medications. Along with asking about usage behaviors, perceived accessibility and risk, the survey also included sociodemographic and geographic questions. Paper (about 20-30 minutes) and online Qualtrics (about 10-15 minutes) versions of the CNA were available in English, Spanish, Chinese, Korean, Armenian, and Khmer. Several questions on the youth survey (aged 12-17) were worded differently from the adult survey (aged 18+).

The misuse (i.e., non-medical use) of Rx medications was defined as any use of Rx medications without a doctor's prescription, in greater amounts than prescribed, more often than prescribed, or for any reason other than what the doctor prescribed them for. Prescription medications included pain killers (e.g., OxyContin, Vicodin, Percocet); sedatives (e.g., Benzodiazepine, Ambien, Xanax, Valium); and stimulants (e.g., Adderall, Ritalin, Concerta).

Introduction (Cont.)

Participant Recruitment

The prevention providers promoted the CNA efforts by mailing SAPC support letters to school administrators and community and business leaders, and by distributing flyers and delivering presentations to prevention agencies, community centers, public events, and other public places (e.g., libraries). In exchange for taking the survey, all participants were offered a \$20 gift card to Amazon, Starbucks, Subway, or Target.

Data Collection

From August 2022 to February 2023, SAPC-contracted prevention service providers administered the survey to a diverse sample of youth and adult participants across LAC from a wide array of community settings, including schools, after-school programs, college campuses, shopping plazas, grocery stores, strip malls, coffee shops, parks, libraries, neighborhood council meetings, public and senior housing developments, churches, farmer's markets, health/resource fairs, health and social services waiting rooms, veteran/low-income housing, community events, government buildings, and YMCAs. Note that much of the youth data was collected outside of the school setting.

Population Weights

Sampling weights accounting for differences in the age, sex, race/ethnicity, and geographic distribution between the sample and population were calculated based on the LAC Internal Services Department's Population Estimates for LAC Tract-City and Countywide Statistical Area Splits (2022). These sampling weights were applied to the sample data to reduce sampling error and to produce estimates representative of the population. Sampling weights could not be calculated for demographic groups not available in the population data. Therefore, population

estimates for some demographic groups, such as the transgender group, were not provided in this report. For Service Provider Area (SPA) and Supervisorial District (SD) population estimates, we allocated sample zip code data to respective SPA and SD based on the proportion of census block population distribution and subsequently calculated sampling weights.

Analytic Sample

After applying the exclusion criteria of individuals <12 years of age and individuals indicating a residency outside of Los Angeles County, we compiled our final sample of 9,221 surveys that were collected by SAPC-contracted prevention providers. Of those 9,221 surveys, records with missing values for any of the population weighting variables (i.e., age, sex, race/ethnicity, zip code) were excluded (N=1,098) from further analysis due to ineligibility for population weighting. The final analysis sample consisted of 8,123 surveys. All missing and unknown response values were excluded from individual calculations where applicable. Estimates with a large proportion of missing values for some categories (e.g., sexual orientation) should be interpreted with caution.

Statistical Methods

Estimates and their variances were calculated using statistical procedures PROC SURVEYFREQ and PROC SURVEYMEANS. Criteria for determining that the estimate is statistically stable included a relative standard error (RSE) less than 30% and a sample size for subgroup analyses ≥ 30 .

Estimates that do not meet these statistical criteria may still be appropriate for planning or policy purposes. Thus, the minimum criteria for RSE were applied and estimates with RSE between

Introduction (Cont.)

30%-50% were reported with an asterisk and note¹. The estimates with RSE greater than 30% and/or sample size < 30 were also not suppressed so that underrepresented populations could be visible in our data. Please interpret with caution. All RSEs were based on non-missing values.

Report Organization

This report provides an overview of the findings of the countywide CNA, including prevalence of prescription medication misuse; misuse behaviors; perceived risk, accessibility, and availability within LAC communities. Results are presented for LAC overall, geographic region (SPA and SD) and by demographics. Key findings are presented in the *Executive Summary* section, and a detailed summary of the findings are presented at the end of the report. Detailed result tables with confidence intervals for all items in the main report are presented in *Appendices A-O*. Statistically significant differences in the estimates between groups can be assessed by examining the confidence intervals; if they do not overlap then the difference is thought to be statistically significant.

Data for Native Hawaiian and other Pacific Islanders (NHOP, N = 46), American Indian/Alaska Native (AI/AN, N = 39) and those indicating “Other” as their racial identity (N = 46) were presented only for prevalence indicators and excluded in all other instances due to the small numbers of respondents indicating they had ever misused prescription medication (N < 15), which was required for most downstream questions. This cutoff was determined via a data-driven approach.

Despite the exclusion, we acknowledge the significance of data pertaining to AI/AN, NHOP, and “Other race” communities for program and policy planning purposes. As such data for these groups are available upon request.

Limitations of CNA

The convenience sampling method may not result in a representative sample of the general LAC population. Non-response bias may be present. All data collected were self-reported, which may not accurately reflect actual misuse, related behaviors, or perceptions. Thus, the results should be interpreted with caution.

Los Angeles County

Service Planning Areas

Los Angeles County (LAC) has been divided into 8 Service Planning Areas (SPA) due to its large size. The Department of Public Health (DPH) develops and provides relevant public health and clinical services targeted to the specific health needs of the residents in these geographic areas.

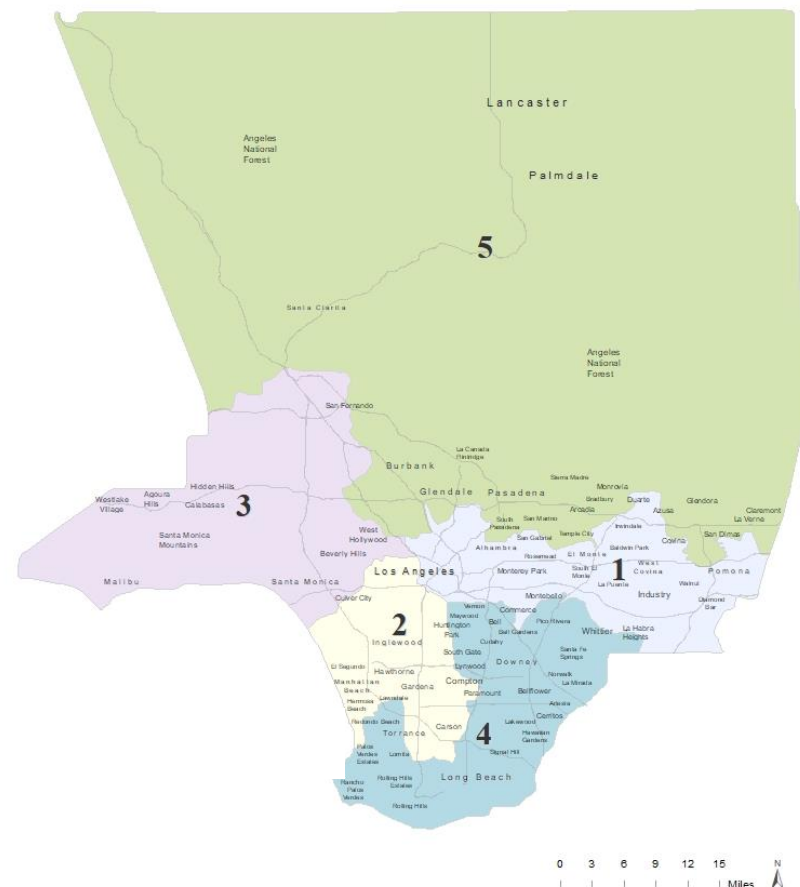

Population (12+), 2022

SPA 1: 347,020	SPA 4: 981,527	SPA 7: 1,087,783
SPA 2: 1,891,979	SPA 5: 586,873	SPA 8: 1,319,956
SPA 3: 1,516,952	SPA 6: 837,922	

Supervisory Districts

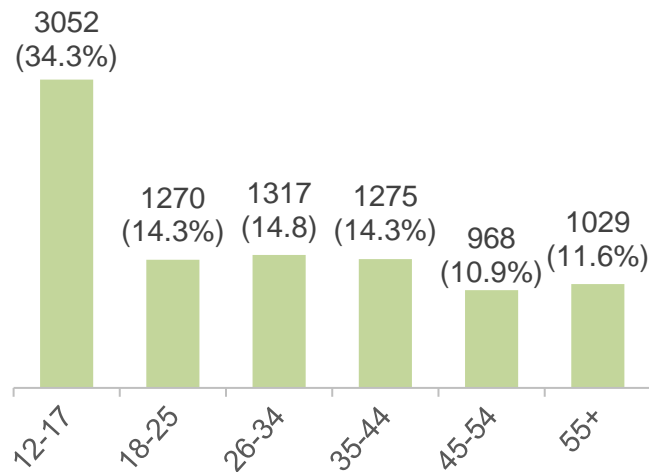

Los Angeles County (LAC) is divided into 5 Supervisory Districts (SD), with each County Supervisor representing a district of approximately 2 million people.

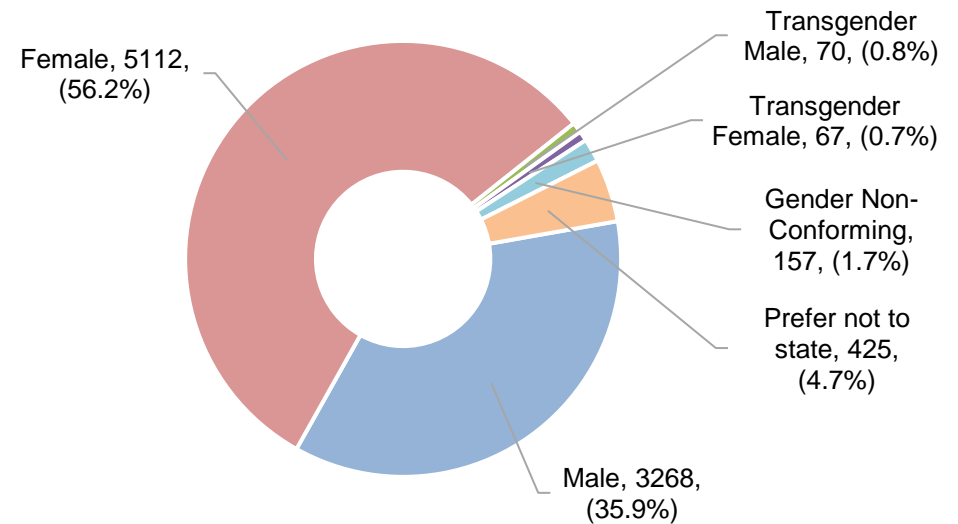

SD 1: 1,695,444	SD 4: 1,770,973
SD 2: 1,690,296	SD 5: 1,634,836
SD 3: 1,778,463	

Sample Demographics (N=9,221)

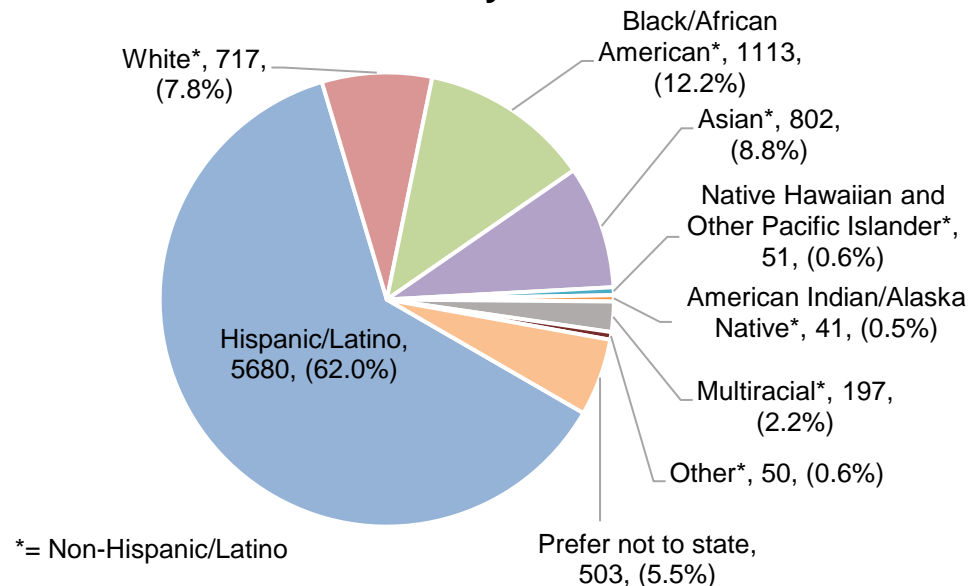

Age (years)

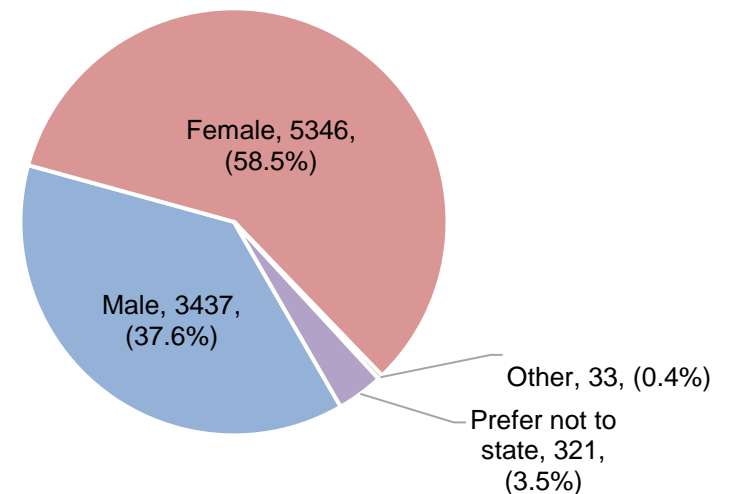

Gender Identity

Race/Ethnicity

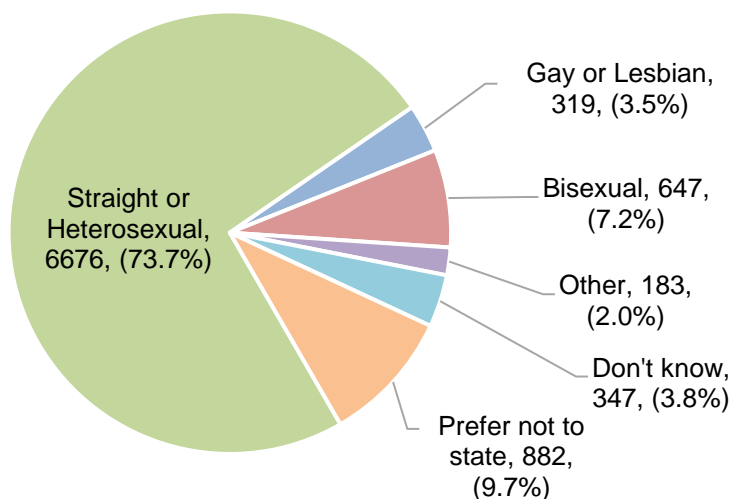

Sex at Birth

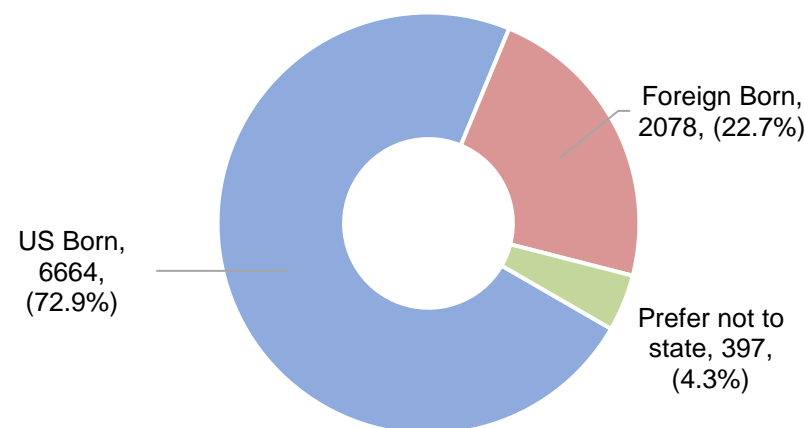

Notes: "Multiracial" indicates that more than one race was selected. Percentages are based on non-missing values and may not sum to 100% due to rounding. Since gender identity (including "transgender") information was not available for sampling weights, sex was used in subsequent analyses. In addition, records with missing values on any of the weighting variables (i.e., age, sex, race/ethnicity, zip code) were excluded (N= 1,098) in the final analysis sample (N = 8,123). Please refer to Appendix A for the demographics of the final analysis sample.

Sample Demographics (Cont.)

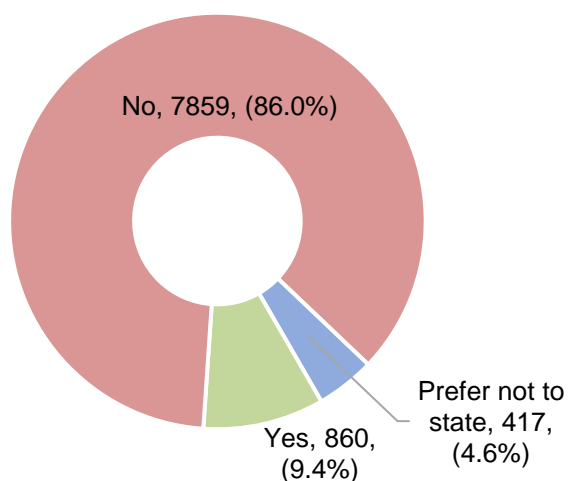

Sexual Orientation

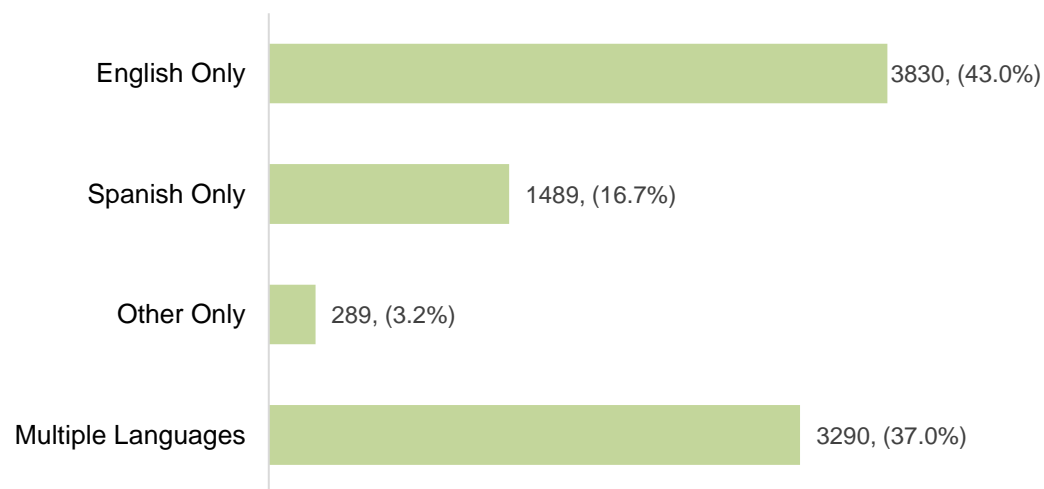

Nativity

Homeless in Past Year

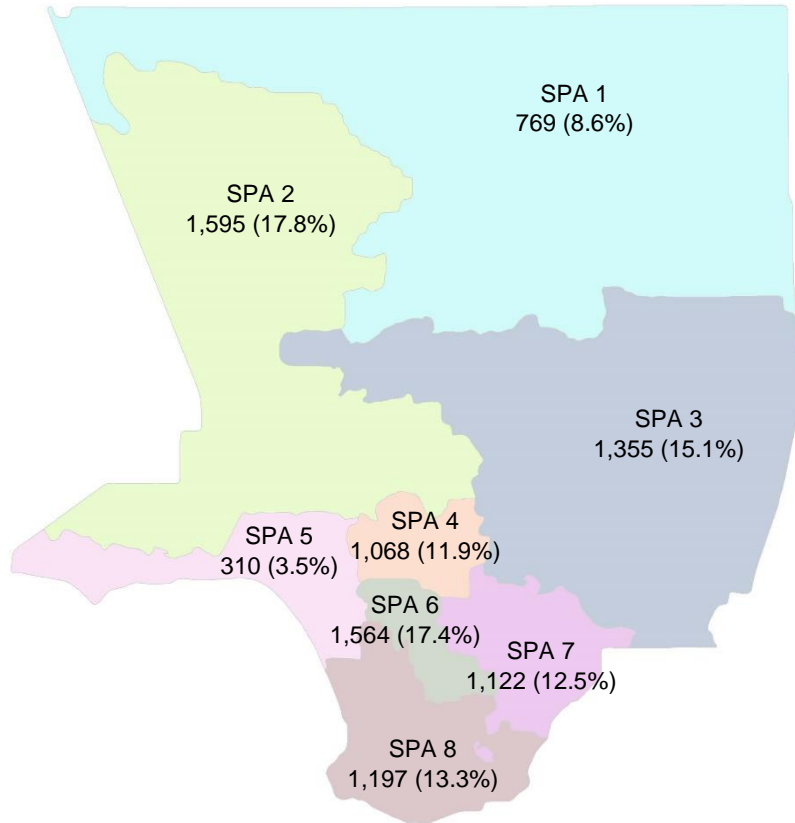

Language(s) Spoken at Home

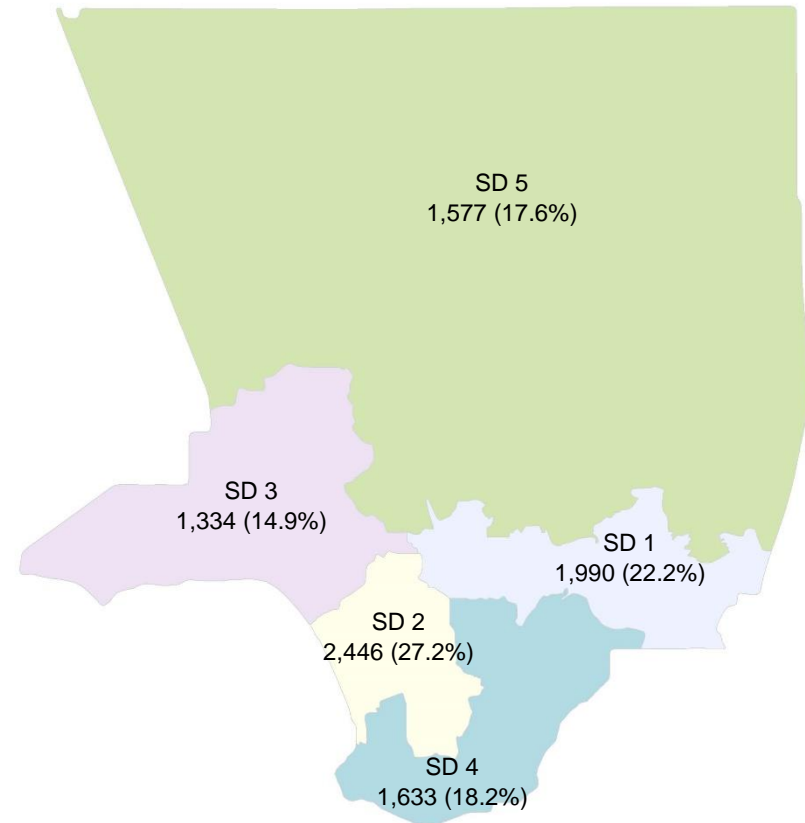

Notes: Records with missing values on any of the weighting variables (i.e., age, sex, race/ethnicity, zip code) were excluded (N= 1,098) in the final analysis sample (N = 8,123). Please refer to Appendix A for the demographics of the final analysis sample.

Geographic Distribution of Sample (N=8,980)

Service Planning Area (SPA)

Supervisory District (SD)

N=8,980 (97.4% of total sample)

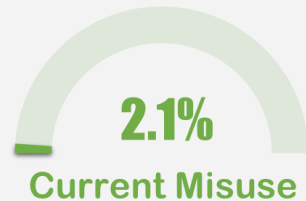

Notes: We allocated sample zip code data to respective SPA and SD based on the proportion of census block population distribution. 97.4% of respondents (N=8,980) provided their current residence zip codes. Please refer to Appendix A for the geographic distribution of the final analysis sample.

Prevalence of Rx Medication Misuse

Ever misused Rx medication (%Yes)

Misused Rx medication in the **past 30 days** (%Yes)

Area	% Lifetime Misuse	% Current Misuse
Service Planning Area (SPA)		
SPA 1	11.0	2.9
SPA 2	13.1	1.3*
SPA 3	10.7	1.7
SPA 4	13.0	2.5*

Figure 13. Attitudes Towards Sharing Prescription Medication by Demographics

---▲--- PWMRx —●— Non-PWMRx

Summary of Findings

Prevalence of Prescription (Rx) Medication Misuse

- Among Los Angeles County (LAC) residents aged 12 and older, 12.7% reported ever misusing prescription medication (e.g., Rx pain relievers, sedatives/benzodiazepines, stimulants) at least once in their lifetimes.
- The prevalence of current Rx medication misuse (at least once in the past 30 days) among LAC residents aged 12 and older was 2.1%. This was higher than that reported in the 2022 National Survey on Drug Use and Health (NSDUH), in which 1.6% of the US population 12 and older reported misusing Rx medication at least once in the past month.
- Lifetime medication misuse was highest among males (16.7%), those aged 26-34 (16.3%), AI/AN individuals (33.7%), US Born (13.9%), and LGBTQ individuals (17.9%).
- Current medication misuse was highest among males (3.1%), young adults aged 18-25 (3.4%), US Born (2.5%), and LGBTQ individuals (4.7%).
- The prevalence of lifetime Rx medication misuse among youth aged 12-17 was 5.3%. This figure was lower than that reported in the Youth Risk Behavior Survey (YRBS) from 2021, in which 11.7% of high school students in the Los Angeles Unified School District reported lifetime misuse of prescription medication.
- The prevalence of current Rx medication misuse among youth aged 12-17 was 1.6%. This was higher than that reported for the same age group in the 2022 NSDUH (0.6%).
- Service Planning Area (SPA) 7 reported the highest prevalence of lifetime misuse of prescription medication (15.4%), followed by SPA 6 (14.3%), SPA 2 (13.1%), SPA 4 (13.0%), SPA 1 (11.0%), SPA 3 (10.7%), SPA 5 (10.4%), and SPA 8 (8.7%).

- Supervisorial District (SD) 2 reported the most respondents currently misusing Rx medication (3.0%), while SD 3 reported the fewest (1.6%).

Frequency of Misuse

- On average, those who misused Rx medication in the past month did so for 9 out of 30 days.

Age of Initiation

- The average age of first misuse of prescription medication among LAC residents aged 12 and older was 21 years; 38.1% of PWMRx¹ first misused prescription medication before age 18.
- Nearly half (49.1%) of PWMRx from SPA 8 first misused Rx medication before the age of 18, while 28.5% of those in SPA 7 first misused before age 18.
- SD 1 reported the highest percentage of those first misusing Rx medication under the age of 18 (50.9%), followed by SD 2 (44.6%), SD 5 (44.4%), SD 3 (27.7%), and SD 4 (27.4%).

Accessibility

- Of those who misused prescription medication at least once in their lifetime, 47.9% reported that prescription medication was somewhat or very easy for them to obtain without a prescription.
- Among youth aged 12-17 who misused prescription medication at least once, 52.6 % reported prescription medication was easy for them to obtain without a prescription.

¹ "PWMRx" indicates a person who has ever misused prescription medication, while "non-PWMRx" indicates someone who has never misused prescription medication.

Summary of Findings (Cont.)

- SPA 6 reported the highest prevalence of PWMRx who indicated it was easy for them to obtain prescription medication without a prescription (58.9%), followed by SPA 5 (54.7%)[†], SPA 1 (54.3%), SPA 7 (50.4%), SPA 8 (48.7%), SPA 3 (42.3%), SPA 4 (41.5%), and SPA 2 (36.6%).
- SD 2 had the highest prevalence of PWMRx who reported it was easy for them to obtain prescription medication without a prescription (56.2%), followed by SD 4 (50.7%), SD 5 (49.8%), SD 1 (44.0%), and SD 3 (34.4%).

Type of Rx Misused

- Among respondents who ever misused Rx medication, 50.3% misused opioids, 40.2% misused sedatives, and 23.5% misused stimulants.
- Opioids were the most common type of Rx medication misused among the following groups: males (57.6%), youth aged 12-17 (45.0%), those aged 35-44 (71.1%), those aged 45-54 (70.1%), Latino individuals (46.1%), White individuals (62.6%), Black/African-American individuals (58.8%), Multiracial individuals (59.8%)[†], US Born (55.4%), heterosexual individuals (52.5%), and LGBTQ individuals (48.8%).
- Sedatives were the most common type of Rx medication misused among females (42.7%), those ages 18-25 (44.7%), those ages 26-34 (46.8%), and Asian individuals (54.3%).
- Compared to others in their demographic groups, the following indicated the highest prevalence of misusing stimulants: females (28.3%), those aged 26-34 (35.1%), Multiracial individuals (45.3%)^{†*}, US Born (27.0%), and LGBTQ individuals (31.2%).

Source of Non-Prescribed Medication

- PWMRx most commonly obtained their prescription medication that they had misused from friends (40.6%), doctors (25.3%), home (23.4%), dealers/illegally (22.4%), and family members (21.2%). “Other” (5.8%) and social media (5.0%) internet accounted for the smallest portion among all sources.
- Friends were the most common source of obtaining prescription medication that was misused for all demographic groups, except youth (ages 12-17), Asian individuals, and those of “Other” sexual orientation. Specifically, youth (12-17) and “Other” sexual orientation indicated home as the most common source (32.1% and 43.1%, respectively). Asian individuals indicated doctors as the most common source (29.8%).
- While only 10.6% of all those who misused Rx medication indicated stealing from friends and family, this source was much more common in youth ages 12-17 (25.2%)
- PWMRx who were born in the United States were more than twice as likely to indicate a dealer as a source of their misused medication than those born outside the United States (25.4% vs. 11.5%).

Rx Medication Misuse Among Close Friends

- About one-tenth (10.7%) of LAC residents aged 12 and older had close friends who misuse prescription medication
- PWMRx were more likely than non-PWMRx² to have close friends who misuse prescription medication (34.9% vs. 7.2%).

[†] The estimate is statistically unstable (sample size < 30); Interpret with caution.

* *The estimate is for planning or policy purposes (RSE is between 30% and 50%); Interpret with caution.

² “Non-PWMRx” indicates a person who has never misused Rx medication, while “PWMRx” indicates someone who has misused.

Summary of Findings (Cont.)

- Reports of having close friends who misuse prescription medication were highest among males (13.2%), adults aged 26-34 (14.0%), Black/African-American individuals (15.9%), those born in the US (12.6%), and LGBQ individuals (14.6%), compared to others in their demographic groups.
- Reports of having close friends who misused prescription medication were highest in SPA 5 (16.9%), followed by SPA 4 (12.9%), SPA 3 (11.5%), SPA 6 (10.8%), SPA 1 (10.6%), SPA 2 (10.3%), SPA 7 (9.4%), and SPA 8 (8.8%).
- Reports of having close friends who misused prescription medication were highest in SD 3 (11.9%), followed by SD 5 (11.8%), SD 1 (11.4%), SD 2 (11.0%), and SD 4 (8.3%).

Rx Medication Misuse Among Family Members

- One-tenth (10.0%) of LAC residents aged 12 and older had family members who misused prescription medication. Those who have misused prescription medication (PWMRx) were more likely than non-PWMRx (those who have not misused) to have family members who misuse prescription medication (31.6% vs. 6.9%)
- Reports of having family members who misuse prescription medication were highest among males (10.8%), adults aged 26-34 (13.8%), Black/African-American individuals (18.6%), those born in the US (11.8%), and LGBQ individuals (14.9%), compared to others in their demographic groups.
- SPA 1 (12.3%) reported the highest prevalence of having family members who misuse prescription medication, followed by SPA 7 (11.6%), SPA 5 (11.0%), SPA 6 (10.1%), SPA 3 (9.8%), SPA 8 (9.4%), SPA 2 (8.7%), and SPA 4 (8.5%).
- SD 5 (13.1%) reported the highest prevalence of having family members who misuse prescription medication, followed by SD 4 (10.1%), SD 2 (9.9%), SD 1 (9.5%), and SD 3 (both 8.3%).

Perceived Accessibility

- Among LAC residents aged 12 and older, 57.8% indicated that prescription pain medication was either “very easy” or “somewhat easy” to obtain on the streets around their neighborhood. This perception was more pronounced for those who had ever misused prescription medication (63.9%) than for those who had never misused prescription medication (56.7%).
- Among youth (ages 12-17), 50.5% indicated that prescription pain medication was easy to access in their neighborhood.
- Compared to others in their demographic groups, the following were the most likely to report that prescription pain medication was easy to access: females (61.5%), those ages 45-54 (60.3%), Black/African-American individuals (62.4%), Foreign Born (59.8%), and LGBQ individuals (58.3%).
- Respondents from SPA 4 were the most likely to indicate that prescription pain medication was easy to obtain (63.9%), followed by SPA 6 (61.2%), SPA 7 (60.7%), SPA 3 (57.8%), SPA 1 (56.1%), SPA 8 (53.2%), SPA 5 (52.2%), and SPA 2 (52.0%).
- Respondents from SD 1 were most likely to indicate that prescription medication was easy to obtain (61.5%), followed by SD 2 (59.2%), SD 4 (58.2%), SD 3 (53.5%), and SD 5 (53.2%).

Perceived Risk of Youth – Regular Rx Medication Misuse

- Of LAC residents aged 12 and older, 69.0% perceived regular Rx medication misuse (1-2 times per week) to be a great risk for youth.
- Perceptions of great risk for youth were more pronounced for those who had not misused prescription medication, as

Summary of Findings (Cont.)

compared to those who had misused (non-PWMRx: 70.4% vs. PWMRx: 58.7%).

- Compared to others in their respective demographic groups, males (64.2%), youth aged 12-17 (53.6%), Latino individuals (68.1%), US Born (67.2%) and LGBTQ individuals (62.1%) were least likely to perceive regular Rx medication misuse to be a great risk for youth.
- SPA 8 (74.5%) had the highest percentage of those perceiving regular Rx medication misuse to be a great risk for youth, followed by SPA 5 (73.0%), SPA 3 (72.3%), SPA 2 (70.0%), SPA 6 (68.9%), SPA 1 (67.9%), SPA 7 (64.9%) and SPA 4 (62.9%).
- SD 5 (71.6%) had the highest percentage of those perceiving regular Rx medication misuse to be a great risk for youth, followed by SD 3 (69.4%), SD 2 (68.9%), SD 4 (68.8%), and SD 1 (67.5%).

Perceived Risk of Adults – Regular Rx Medication Misuse

- Of LAC residents aged 18 and older, 68.3% perceived regular misuse of prescription medication (1-2 times per week) to be a great risk for adults.
- Those who had ever misused prescription medication (PWMRx) were less likely to indicate great risk for regular adult misuse than those who had never misused prescription medication (PWMRx: 57.0% vs. non-PWMRx: 70.2%).
- Compared to others in their respective demographic groups, males (65.1%), those aged 18-25 (58.5%), Multiracial individuals (61.4%), and LGBTQ individuals (59.7%) were least likely to perceive regular misuse of prescription medication to be a great risk for adults.

- SPA 1 was the mostly likely to perceive regular misuse of prescription medication to be a great risk for adults (71.9%), followed by SPA 3 (71.0%), SPA 5 (70.6%), SPA 8 (69.6%), SPA 6 (68.5%), SPA 4 (67.8%), SPA 7 (66.3%), and SPA 2 (65.8%).
- SD 5 (72.0%) was the most likely to perceive regular Rx medication misuse to be a great risk for adults, followed by SD 4 (68.8%), SD 2 (68.4%), SD 1 (66.9%), and SD 3 (66.8%).

Perceived Social Disapproval

- Of LAC residents aged 12 and older, 86.3% perceived that their close friends would either disapprove or strongly disapprove if they misused prescription medication.
- People who have misused prescription medication (PWMRx) were less likely to think their close friends would disapprove of their prescription medication misuse (69.8%) as compared to those who have not misused prescription medication (88.8%).
- Compared to others in their respective demographic groups, the following had the highest prevalence of perceiving that their close friends would disapprove of them if they misused prescription medication: females (88.6%), those aged 45-54 (88.5%), White individuals (88.2%), US Born (87.1%), and heterosexual individuals (87.6%).
- Respondents from SPA 5 were most likely to perceive disapproval from close friends if they misused prescription medication (92.5%), followed by SPA 3 (90.3%), SPA 8 (87.1%), SPA 2 (85.9%), SPA 7 (85.6%), SPA 4 (85.5%), SPA 6 (84.2%), and SPA 1 (83.1%).

Summary of Findings (Cont.)

- Respondents from SD 1 were most likely to perceive disapproval from close friends if they misused prescription medication (88.8%), followed by SD 5 (86.3%), SD 3 (86.0%), SD 4 (85.7%), and SD 2 (84.9%).

Unused Rx Medications

- Nearly one-fifth (19.6%) of LAC residents aged 12 and older reported they have unused or expired (left-over) Rx medication where they live.
- Compared to others in their respective demographic categories, the following reported the highest prevalence of having used or expired Rx medication where they lived: females (23.2%). White individuals (29.1%), US Born (20.3%), and LGBTQ individuals (23.0%).
- Having unused or expired Rx medication where they live increased with age from 10.8% among those aged 12-17 to 24.9% among those aged 55 and older.
- SPA 5 (38.8%) had the highest percentage of respondents who reported having unused or expired Rx medication where they live, followed by SPA 2 (21.9%), SPA 8 (21.4%), SPA 3 (20.7%), SPA 4 (19.2%), SPA 7 (17.1%), SPA 1 (16.9%), and SPA 6 (16.4%)
- SD 3 had the highest percentage of respondents reporting unused or expired Rx medication where they live (22.6%), followed by SD 5 (22.5%), SD 2 (19.1%), SD 1 (18.9%) and SD 2 (17.4%).

Safe Disposal

- Over one-third (34.4%) of LAC residents aged 12 and older believed the best way to dispose of unused Rx medication was to drop them off at drop-off locations or take-back events.

However, many believed that flushing them down the toilet (23.9%), and throwing them in the trash (23.4%) were the best ways to dispose of them.

- Nearly four-in-ten (37.7%) youth ages 12-17 believed that throwing Rx medication in the trash was a good way to dispose of them, while almost a quarter reported that they did not know how to properly dispose of them (23.1%).

Attitudes Towards Sharing Rx Medications

- Of LAC residents 12+ years of age, 14.0% indicated that they would either “agree” or “strongly agree” that it is okay to share used or expired (left-over) Rx medication with family or friends who need them.
- Those who ever misused prescription medication were more likely than those who had never misused to indicate that sharing used or expired medication was acceptable (23.8% vs. 12.5%).
- The following groups indicated the highest levels of agreement that it was okay to share unused or expired (left-over) Rx medication: those ages 12-17 (18.8%), those ages 18-25 (18.6%), and Asian individuals (18.3%).
- SPA 5 (20.3%) had the highest percent of respondents who reported approval of sharing unused or expired Rx medication with friends or family, followed by SPA 8 (17.5%), SPA 3 (17.0%), SPA 4 (14.8%), SPA 6 (13.0%), SPA 1 (12.6%), SPA 7 (11.8%), and SPA 2 (11.4%).
- SD 1 had the highest percentage of respondents (15.5%) who reported approval of sharing unused or expired Rx medication with friends or family, followed by SD 4 (14.8%), SD 5 (14.6%), SD 2 (12.7%), and SD 3 (12.3%).

SD 3	1,186	14.6%
SD 4	1,483	18.3%
SD 5	1,476	18.2%

Notes: AI/AN includes "American Indian" and "Alaska Native".

NHOPi includes "Native Hawaiian and Other Pacific Islander".

"Other" sexual orientation included those who indicated "Other" and those who indicated "Prefer not to answer".

SPA and SD were based on zip code of residence, calculated based on the proportion of census block population distribution.

Percentages are based on non-missing values and may not sum to 100% due to rounding.
